Hi team,

My role was support for both backend and frontend.

Here are my contributions for the Pathwise project:

- I supported the backend and frontend integration for the vertical prototype.
- I helped improve the dashboard, goals, projects, milestones, bookmarks, profile, reflections, messages, and other resource related flows.
- I reviewed the database schema and API struct to see if the implementation matched our P1 functional requirements
- I helped find and fix bugs that were related to routing, dashboard layout, visibility of resources, recommendations, and frontend/backend compatibility.
- I contributed by polishing the UI by improving the dashboard readability, navigation consistency, page organization, and usability.
- I documented the codebase by writing clear header comments for each main file explaining their purpose, usage, and how they tie up with every other main file.
- I supported SQL setup to allow for a fresh development environment for those who haven't done so locally by dumping off the server and adding the missing SQL file.
- I helped prepare the application to be more organized, working as intended and demo-ready for the milestone.
- I improved the reflections page by removing the ID-based linking feature with a user-facing selection interface. Now users can link to not only multiple goals and projects but also milestones using a structured selection tree.
- I also supported the backend by adding new join tables and updating the APIs, while the frontend was updated to show the selectable options and display the items in the reflection history.

Number of GitHub submissions to the main/team branch: **23**

NOTE: I primarily pushed changes to my own separate branch (41 pushes total) which later merged in batches.

Best,

Mikias Berhane
